Climate change means long-term changes in the weather. This is a range. The range, for example, changes between 10 years, 100 years or 1000 years, the climate becomes colder or hotter. The causes of climate change are almost caused by human activities.

An example of climate change is the greenhouse effect, where the greenhouse effect leads to faster melting of icebergs in the Arctic and faster sea level rise, An example of climate change is the greenhouse effect, where the icebergs are melting faster and the sea level is rising faster. Tuvalu is a country in the South Pacific. This country is made up of many islands. From 1993 to 2019, the sea level of this country has risen by a total of 9.12 cm. Scientists estimate that after 50 years, the sea level will rise by 37.6 cm. At least 60% of Tuvalu's land will be completely sunk into the sea.
